

AMENDMENT TO THE CLAIMS

Please cancel Claims 5-17 and 20-21 without prejudice and amend Claims 1, 3 and 19 as shown in the following listing of the claims:

1. (Currently amended) A method for determining whether a HIV-1 has an increased likelihood of being hypersusceptible to treatment with a ~~protease inhibitor~~ amprenavir, comprising: detecting whether the protease encoded by said HIV exhibits the presence or absence of a mutation associated with hypersusceptibility to treatment with ~~said protease inhibitor~~ amprenavir at amino acid position corresponding to position 16, 20, 33, 36, 37, 39, 45, 65, 69, 77, or 89 or 93 of an amino acid sequence of said protease of SEQ ID NO:1, wherein the mutation at amino acid position corresponding to position 39 of SEQ ID NO:1 is S, the mutation at amino acid position corresponding to position 65 of SEQ ID NO:1 is D, the mutation at amino acid position corresponding to position 69 of SEQ ID NO:1 is K, and the mutation at amino acid position corresponding to position 89 of SEQ ID NO:1 is M, and wherein the presence of said mutation indicates that the HIV has an increased likelihood of being hypersusceptible to treatment with ~~the protease inhibitor, with the proviso that said mutation is not L33F~~ amprenavir.
2. (Original) The method of claim 1, wherein the protease has a sequence that is greater than 80% identical to SEQ ID NO:1.
3. (Currently amended) A method for determining whether an individual infected with HIV-1 has an increased likelihood of being hypersusceptible to treatment with a ~~protease inhibitor~~ amprenavir, comprising detecting, in a sample from said individual, the presence or absence of a mutation associated with hypersusceptibility to treatment with a ~~protease inhibitor~~ amprenavir at amino acid position corresponding to position 16, 20, 33, 36, 37, 39, 45, 65, 69, 77, or 89 or 93 of an amino acid sequence of said protease of SEQ ID NO:1, wherein the mutation at amino acid position corresponding to position 39 of SEQ ID NO:1 is S, the mutation at amino acid position corresponding to position 65 of SEQ ID NO:1 is D, the mutation at amino acid position corresponding to position 69 of SEQ ID NO:1 is K, and the mutation at amino acid position corresponding to position 89 of SEQ ID NO:1 is M, and wherein the presence of said mutation indicates that the individual has an increased likelihood of being hypersusceptible to treatment with ~~the protease inhibitor, with the proviso that said mutation is not L33F~~ amprenavir.

4. (Original) The method of claim 3, wherein the protease has a sequence that is greater than 80% identical to SEQ ID NO:1.
- 5.-17. (Canceled).
18. (Original) The method of claim 3, wherein the individual is undergoing or has undergone prior treatment with an anti-viral drug.
19. (Currently amended) The method of claim 1, wherein the method comprises detecting the presence or absence of a mutation associated with hypersusceptibility to treatment with ~~said~~ protease inhibitor at at least 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 or 12 or 4 of the amino acid positions.
- 20.-21. (Canceled).
